

# Installation of the drawer brace (short drawer)

Under heavy loads the drawer sidewalls will deflect inward

The drawer brace restricts this deflection and can be positioned in different places

**A) ~MID-POINT**; This position will perform the best with very heavy loads (>100 lbs.)

**B) DIMPLES**; A compromise between the other two choices

**C) CABSIDE**; This will provide best access to the entire drawer

BTW: If the vertical walls of the drawer deflect, this won't hurt the drawer or cause permanent distortion
